

GENERAL INSTRUCTIONS

- The mappings are indicative of the risk phenomena present on the surface. These surfaces indicate a realistic percentage of the area to be treated. **The price of the required works is however fixed at the rate.** After the installation of the scaffolding and before starting the restoration work, the contractor must carry out a survey of all surfaces to verify and update the mappings.
- At all processes, all the materials and all the materials must be tested on site,** before being used, and submitted for approval by the works manager and UNOD site manager.
- It is **forbidden to use concrete materials or materials based on cement or very small loads of cement.**
- The contractor must update the BIM model with all the data relating to the state of conservation and the work carried out, in order to deliver to the contracting authority an "as built" final design.
